

End-to-End Mobile Device Management

Today's full-featured mobile devices have become indispensable tools in a broad range of industries, enabling enhanced productivity, efficiency and customer service. But IT departments often struggle to manage, secure and support the vast numbers of mobile devices flowing into their organizations.

To help meet these demands, ProSys has developed a mobile device management (MDM) solution suite encompassing consulting, best-of-breed technologies, and comprehensive configuration and logistics services. Working with our application development partners, we help customers determine the right applications for their mobile strategies and the best way to present existing applications to mobile devices.

Management Essentials

Our integrated MDM platform helps manage and secure mobile devices, applications, content and email across your organization. The ProSys MDM solution's rich feature set includes:

- ensuring compliance with security protocols
- separating personal and corporate data
- delivering application updates and patches
- enforcing data encryption
- remotely wiping data and/or locking down lost or stolen devices

This solution can be implemented on-premises or in the cloud, and provides a flexible model for asset management, policy enforcement, and distribution of profiles and applications based upon device ownership.

Security and Access Control

Corporate security measures have not kept pace with the threats brought by mobility. ProSys offers powerful security solutions that increase IT efficiency and improve compliance:

- set policies based on the user, device, location and the resources accessed
- deliver unified policy enforcement across networks
- deliver the right levels of security in all segments of the network through fine-grained controls that combine context, identity, policy and threat intelligence
- quickly provision user-owned devices through zero-touch onboarding

Innovative licensing allows you to choose the functionality you need and deploy it as a physical or virtual appliance that integrates with existing network devices and directory services.

Configuration, Deployment and Logistics

ProSys can help organizations gain immediate productivity benefits from mobile devices. Through its state-of-the-art Integration Center, ProSys enables rapid roll-outs of mobile devices across the organization with limited impact on IT operations. This fully automated solution includes:

- customized imaging, packaging and asset tagging
- device staging, including configuration and software updates
- device activation
- inventory management
- direct shipping of thousands of mobile devices

ProSys also offers BizXchange, a customized portal that enables users to choose from a set of approved devices and accessories. Each order goes through a workflow based upon the customer's approval process. Once approved, the order is placed with the ProSys Integration Center so the device can be properly configured, packaged and shipped to the end-user.

Where Do You Go from Here?

Experts say that mobility and BYOD are becoming a business requirement and recommend that organizations develop a mobility strategy as well as policies, procedures and tools for mobile device management. ProSys is your go-to partner for an end-to-end mobility solution that supports and enhances your operations while ensuring security and control.
